A search for dark matter using sub-PeV gamma-rays observed by Tibet AS,

Tarak Nath Maity

Based on

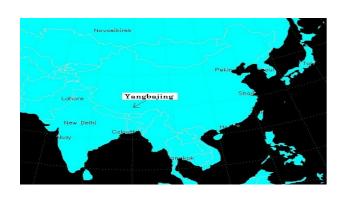

TNM, A K Saha, A Dubey, R Laha 2105.05680

CHEP, IISc Bangalore

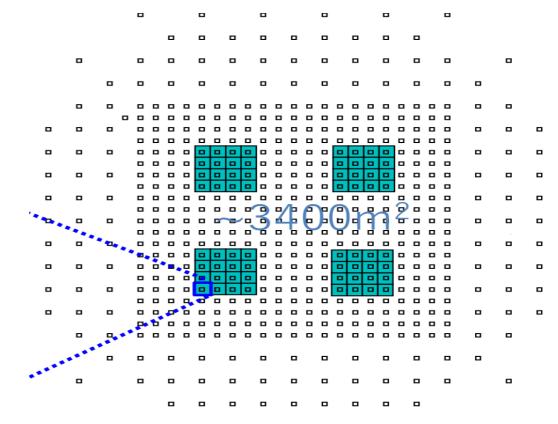

Asia-Pacific Workshop on Particle Physics and Cosmology 2021

Tibet AS+MD

- ✓ Area: ~1.5 Eiffel tower
- ✔ Hybridize with muon detector.
- ✓ 2.4 m underground
- ✓ Muon with energy greater than 1 GeV

Livetime: 719 days from February 2014 to May 2017

Muon detector: gamma and cosmic ray (CR) discrimination

What is it observing?

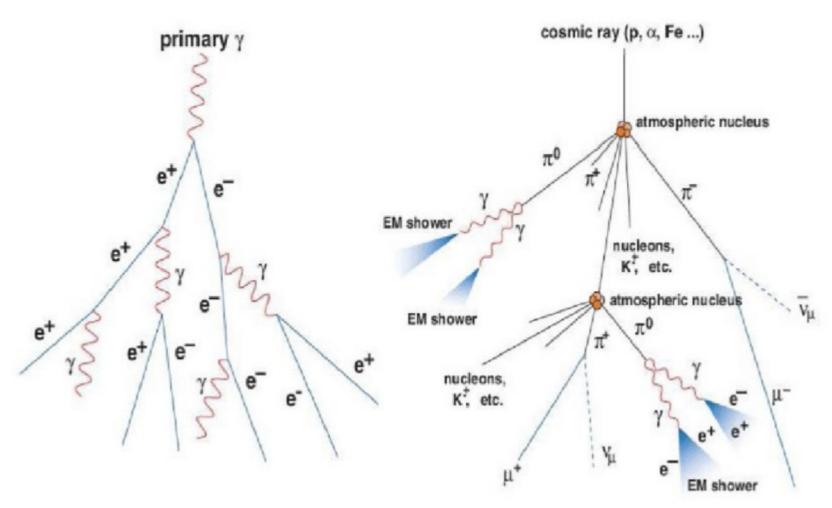

✓Are not deflected by interstellar magnetic fields.

✓ Observation of ~100 TeV gamma ray predict the Galactic origin of the PeV cosmic ray.

© Google

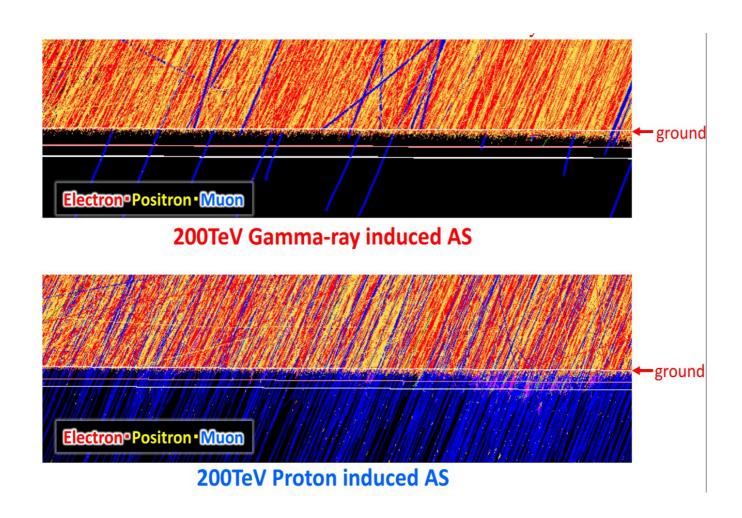

How? Photon and Proton Shower

© Google

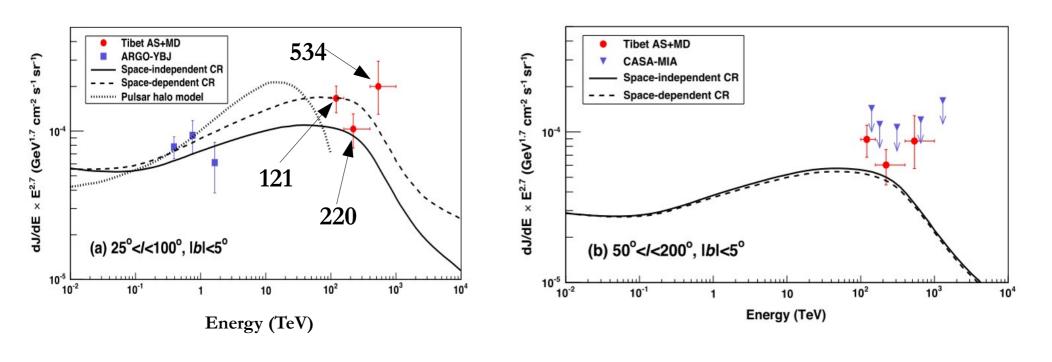

Occasional γ -p interaction gives rises shower similar to hadronic shower

How? Photon and Proton Shower

✓ After muon cut,~99.9% CR rejection & ~90% gamma efficiency @100 TeV

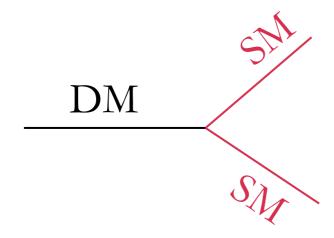

Result: Observed Flux

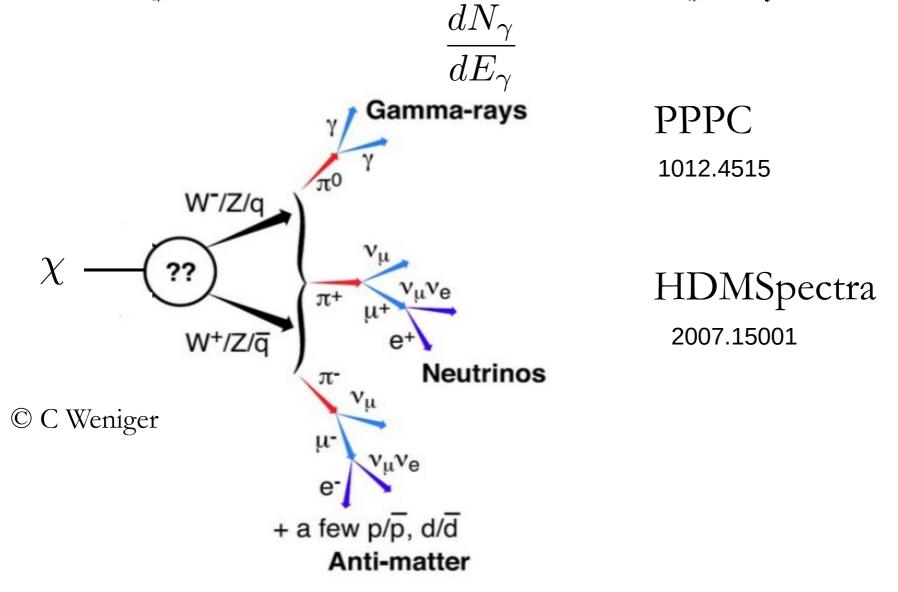

- ✓ First detection of sub-PeV diffuse gamma rays.
- ✓ Space dependent and space independent cosmic ray model seems to fit well with data, proposed in 1804.10116
- ✓ Several recent proposals e.g., see 2104.09491, 2104.03729, 2104.05609

What are we doing?

Observed Flux: Whether this observation could be used for detection of dark matter?

Decaying DM: gamma-ray spectrum

Decaying DM + Background < Data

DM Flux

$$\frac{d^{2}\phi_{\gamma}}{dE_{\gamma}d\Omega}(E_{\gamma}) = \frac{1}{\Delta\Omega} \int_{\Delta\Omega} d\Omega \frac{1}{4\pi m_{\chi} \tau_{\chi}} \frac{dN_{\gamma}}{dE_{\gamma}}(E_{\gamma})$$

$$\int_{0}^{s_{\text{max}}} (\rho_{\chi}(s, b, l)) e^{-\tau_{\gamma\gamma}(E_{\gamma}, s, b, \ell)} ds$$

Decaying DM: Limits

• We have done a χ^2 analysis to set the limits.

Decaying DM Limits: DM profile

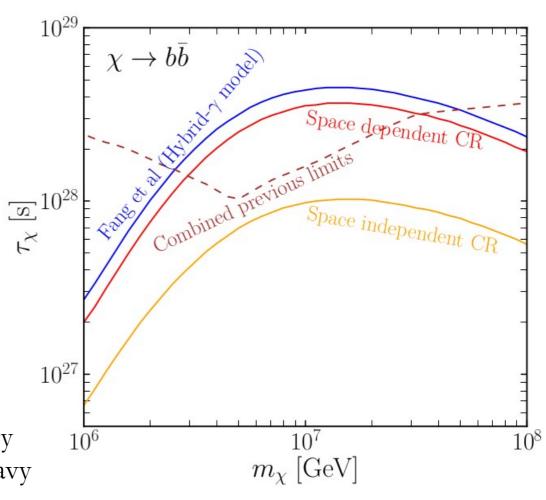

@ Our limits are robust.

Conclusion

 \checkmark Recently, Tibet AS $_{\gamma}$ collaboration has discovered the first sub-PeV diffuse gamma-rays from the MW Galactic disk.

- ✓ Data broadly agrees with prior theoretical expectations
- ✓ We study the impact of this discovery on PeV scale decaying DM
- ✓ We find that data provides strongest bound on most of the final states
- → Near future data of these high-energy gamma-rays can be used to discover heavy decaying DM.

Photon Proton Shower: Tibet AS,

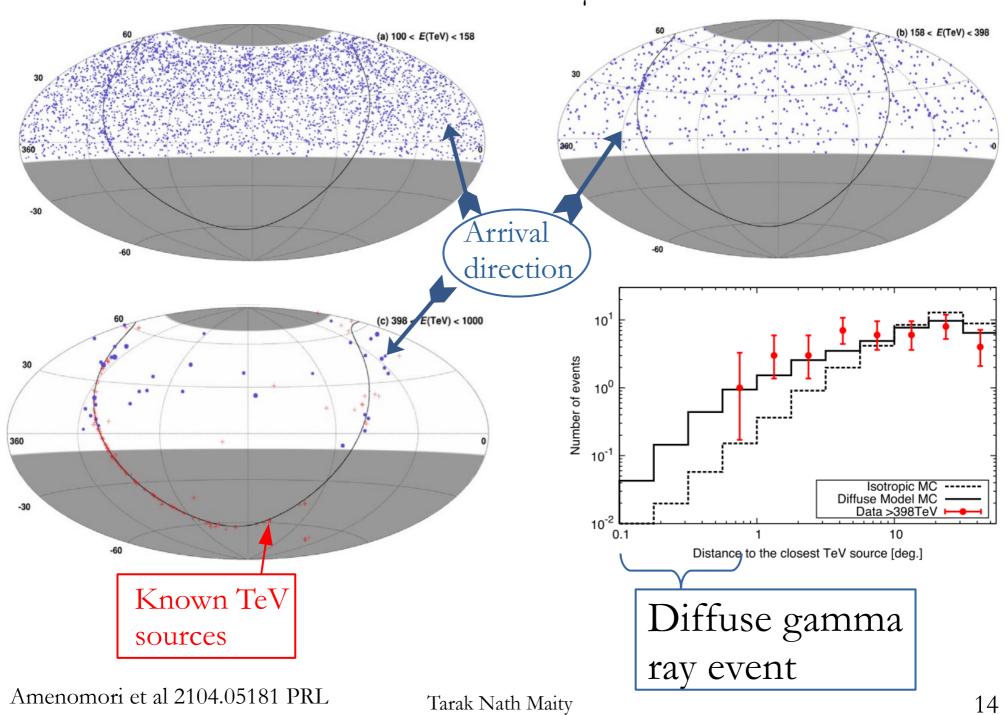

Percentage of γ-	N_{μ} $<$ 75	N_{μ} < 100	N_{μ} < 200	N_{μ} < 300
ray signals retained	10%	20%	60%	83%
Level of cosmic- ray background				
Solid line fit	10^{-5}	1.5×10^{-5}	4×10 ⁻⁵	10^{-4}
Dashed line fit	$< 10^{-7}$	10^{-7}	6.6×10^{-7}	4×10^{-6}

Gaisser et al PRD 91'

✓ After muon cut,~99.9% CR rejection & ~90% gamma efficiency @100 TeV

Tibet AS,

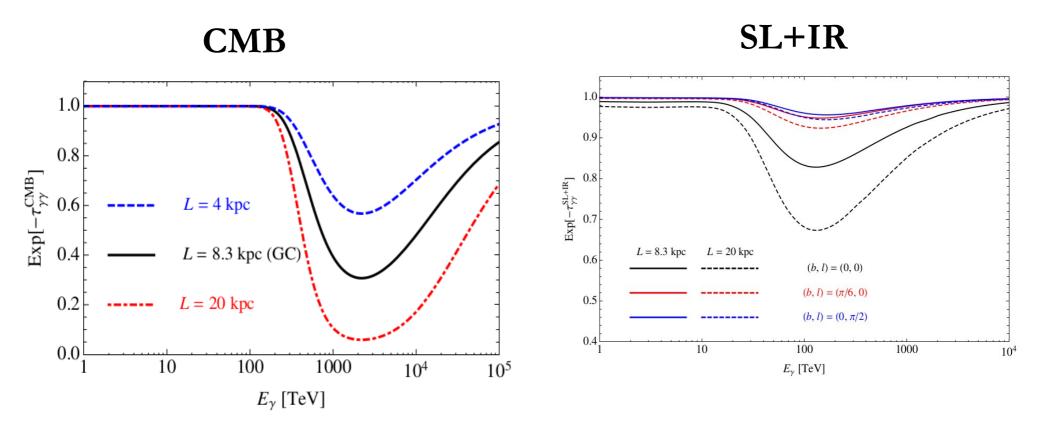

Decaying DM: Altenuation

Pair production:
$$\gamma + \gamma_b \rightarrow e^+ e^-$$

 γ_b Starlight
Infrared

Attenuation $\sim e^{(-L/\lambda)}$

Mean free path $\lambda = 1/n_b \sigma_{\gamma\gamma}$

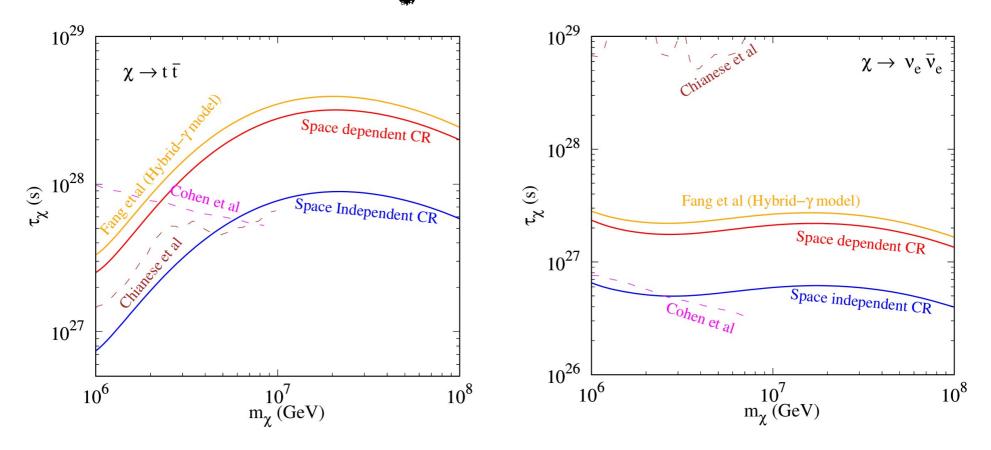

@ A 100 TeV photon must originate from our galaxy.

Decaying DM: Limits

- ✓ For some of the channels (e.g., $t\bar{t}$) our bounds are stronger than previous limits.
- ✓ For some of the channels (e.g., $\nu\bar{\nu}$) our bounds are not as strong as previous limits.
